## SUMMARY & SKILLS

• **Ph.D. in Applied Mathematics & Statistics (Computational Biology Track)** | 2 yrs post-doc + 2 yrs biotech startup + 3 yrs wet-lab (synthetic barcoding-based *in vivo* lineage tracing, molecular biology) • **Skills:** Bayesian optimization, algorithms, machine learning (deep generative model), bioinformatics, data analysis & visualization, Python (NumPy, Matplotlib, pandas, tkinter, Flet), MATLAB, SQL, Git • Strong analytical thinker; detail-oriented, organized, and goal-driven.

## INDUSTRIAL & ACADEMIC EXPERIENCE

### Online AI Training with Certificates 9/2025-current

Artificial Intelligence Professional Program, Stanford

- XCS236 Deep Generative Models (Certificate)
- XCS231N Deep Learning for Computer Vision (Certificate)

### Computational Biology Staff Scientist 11/2023-8/2025

BacStitch DNA, South San Francisco, CA

- **Developed an automated end-to-end DNA assembly workflow (Python, web/GUI)** that scores sequences, designs optimal overlapping blocks, checks synthesizability via supplier APIs, and generates automated high-throughput experimental plans.
- **Built a Python tool for optimal DNA block design** that segments sequences into overlapping blocks with minimal structural features in overlaps, under customizable constraints on block count, block/overlap length, and specific regions forced as blocks/overlaps.
- **Created Python visualization tools** to (i) plot BLAST results and structural scores (*Example*), (ii) generate *.ab1* files encoding structural scores as ATGC traces at single-nucleotide resolution, and (iii) produce publication-quality figures for publications and internal use.

### Postdoctoral Research Fellow 4/2021-10/2023

Sherlock Lab at Department of Genetics, Stanford University, CA

- Developed a Bayesian optimization algorithm and Python pipeline (*FitMut2*) to identify genome-wide adaptive lineages from fitness phenotypes (without WGS) in experimental evolution and estimate mutation fitness effects and occurrence times.
- Developed an optimization algorithm to segment DNA sequences into overlapping fragments that minimize overlap-region scores (e.g., undesirable DNA structural features) under fixed or ranged constraints on fragment count and fragment/overlap length.

### Artificial Intelligence Fellow 9/2019-10/2019

Insight Data Science, San Francisco, CA

- Developed a deep learning pipeline for portrait editing (a 6-week project), providing continuous adjustment of facial features.

### Graduate Researcher 8/2014-12/2020

Laufer Center for Physical and Quantitative Biology, Stony Brook University, NY

- Developed a fitness estimation tool (*Fit-Seq*) that can estimate unbiased fitness for complex cell pools, using a maximum likelihood algorithm.

- Designed and conducted *in vivo* bar-seq experimental yeast evolution (yeast genetics, cloning, barcoded library construction, lineage-traced evolution, and NGS prep). Performed computational analysis (NGS processing, mathematical modeling for inferring evolutionary parameters from lineage dynamics, and evolutionary simulations for validation) to explore the epistasis of adaptive mutations in yeast evolution.

**EDUCATION**     **Ph.D., Applied Mathematics and Statistics (Computational Biology)**——8/2013–12/2020  
Stony Brook University, Stony Brook, NY

**M.S., Systems Theory**—————9/2010–7/2013  
University of Chinese Academy of Sciences, Beijing, China

**B.S., Mathematics and Applied Mathematics**—————9/2006–7/2010  
Beijing Normal University, Beijing, China

**PRESENTATIONS**     **Plenary Talk: Fitness Estimation of Pooled Amplicon Sequencing Studies**——8/2018  
2018 Yeast Genetics Meeting, Stanford CA, 8/22/2018–8/26/2018
